

Selective damping across four golden-ratio grids

Four equally spaced starts in Hz between 2 and $2/\phi$; lower endpoint excluded. Golden spacing within each grid.

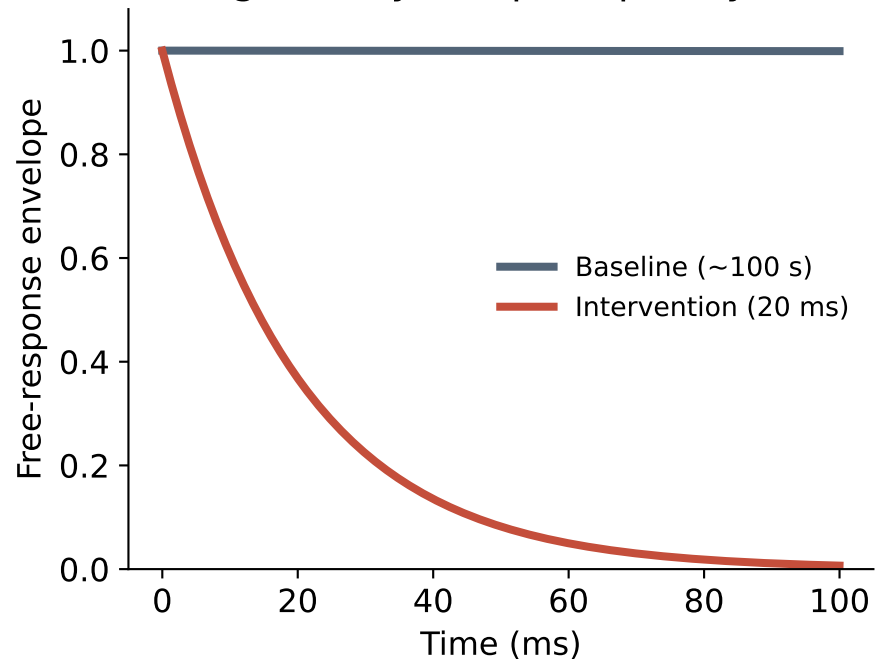

11 nodes in every grid

Teal: lowest 4 Red: highest 4
Yellow: task modulation range

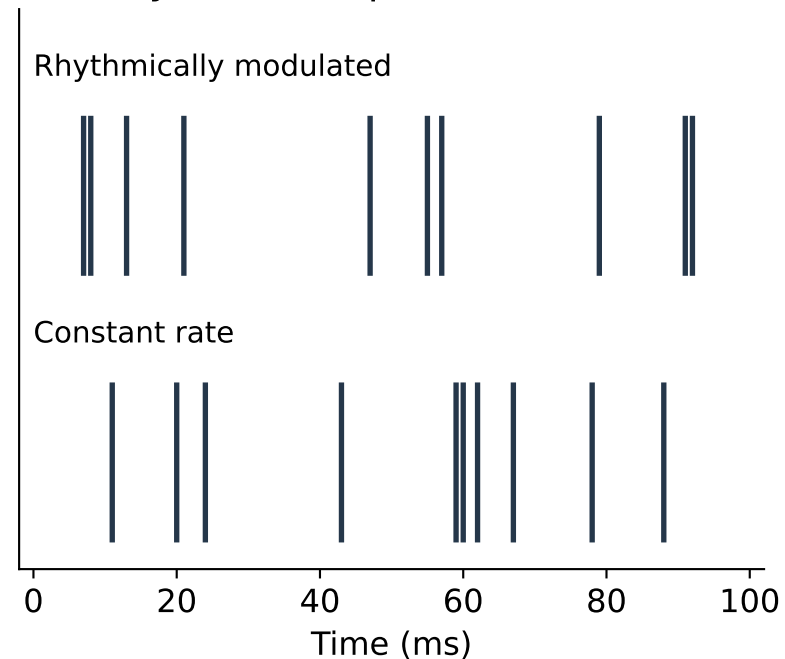

4 grids $\times$ 3 damping conditions $\times$ 3 matched training seeds = 36 fits. Models retrained in each condition.

Change decay, keep frequency

Intervention applied to either group;
all other nodes retain baseline damping.

Classify 100 ms spike trains

Modulation sampled from 10-50 Hz.
Same train / validation / test data.
